

A BLOOD TEST AT MY DENTIST ?

Your dentist is equipped with a Linkor® Blood Analyzer

A pre-operative blood test is performed your general health before dental surgery. Certain blood markers allow an estimation of the immune system state, bone health and healing abilities.

This assessment ensures that you are in good health, in order to achieve the most favorable possible results.

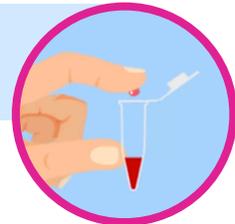

Do we take a lot of blood?

No, a few drops of capillary blood (at the fingertip) are enough.

How does the procedure work?

Step 1: Blood sampling

Directly to the dental office
At the time of your pre-surgical consultation

Step 2: Insertion inside the Linkor®

With a single-use reagents kit
The analysis takes 15 minutes

Step 3: Results analysis

More than 40 values are analyzed
With integrated inflammatory index calculation

The entire clinic team is here to answer your questions
